## UNBRIDLED POWER: UNDERSTANDING THE 2014 HONDA GOLD WING VALKYRIE HORSEPOWER

---

When Honda decided to revive the Valkyrie nameplate for the 2014 model year, they set out to create something genuinely distinct. They took the legendary flat-six engine from the Gold Wing, stripped away the massive touring

fairings, and built a power cruiser that would capture the imagination of riders who craved raw, unadulterated performance. At the very heart of this machine lies a question that dominates every discussion about it: just what is the 2014 Honda Gold Wing Valkyrie horsepower, and how does that translate into real-world riding exhilaration?

The answer is both impressive and surprisingly nuanced. The 2014 Honda Gold

Wing Valkyrie produces approximately 113 horsepower at the rear wheel and delivers a stump-pulling 108 lb-ft of torque. But these numbers only begin to tell the story. This is an engine that doesn't just produce power; it delivers it with a character, a soundtrack, and a sense of occasion that few motorcycles can match. Let us dive deep into what makes this powerplant so special and why the horsepower figures matter far less than the experience they enable.

---

### **THE HEART OF THE BEAST: THE 1832CC FLAT-SIX ENGINE**

---

The engine powering the 2014 Honda Gold Wing Valkyrie is a liquid-cooled, 1832cc

horizontally opposed six-cylinder. This is not a new engine; it is a thoroughly reworked version of the powerplant found in the Honda Gold Wing, but with significant modifications to suit the Valkyrie's mission as a power cruiser rather than a long-distance tourer.

One of the most important changes for the Valkyrie application was the intake and exhaust tuning. Honda engineers designed a new intake system with individual throttle bodies and a revised airbox that allowed the engine to breathe more freely. The exhaust system, with its distinctive six-into-two-into-one configuration featuring dual mufflers, was tuned to produce a deep, rumbling tone

that is unmistakably Valkyrie. These changes did not dramatically increase the peak 2014 Honda Gold Wing Valkyrie horsepower figures compared to the Gold Wing, but they shifted the power delivery to create a more exciting and engaging experience.

## How the Valkyrie Engine Differs from the Gold Wing

While the basic architecture of the

engine remains the same, Honda made several key changes to tailor the Valkyrie's character:

- **Retuned ECU mapping:** The fuel and ignition maps were optimized for a sportier power delivery, emphasizing mid-range torque and throttle response.
- **Revised camshaft profiles:** Slightly more aggressive cam timing was used to improve top-end breathing without sacrificing the low-end grunt that makes the Valkyrie so enjoyable.
- **Individual throttle bodies:**

Unlike the Gold Wing's linked system, the Valkyrie uses six individual 40mm throttle bodies, one per cylinder, for sharper throttle response.

- **Lighter flywheel:** The Valkyrie uses a lighter flywheel than the Gold Wing, allowing the engine to rev more freely and respond more quickly to rider inputs.
- **Unique exhaust system:** The free-flowing exhaust not only sounds incredible but also reduces back pressure, contributing to the engine's willingness to rev.

These modifications mean that the 2014 Honda Gold Wing Valkyrie horsepower is delivered with noticeably more enthusiasm than in the touring-oriented Gold Wing. The engine feels livelier, more eager, and genuinely exciting to use across the entire rev range.

---

### **TORQUE: THE VALKYRIE'S TRUE SUPERPOWER**

---

If horsepower is the headline, torque is the story that keeps you reading. The 2014 Honda Gold Wing Valkyrie delivers its peak torque of approximately 108 lb-ft at just 4,000 rpm. But what truly sets this engine apart is how much torque it produces from idle all the way to redline. You do not need to wring

the engine out to access its performance. Simply rolling on the throttle from any rpm produces immediate, forceful acceleration.

This abundance of low-end and mid-range torque is what makes the Valkyrie such a deceptive motorcycle. Despite weighing over 700 pounds wet, the Valkyrie accelerates with a ferocity that surprises riders who are accustomed to typical cruisers. The engine pulls from 1,500 rpm without any hesitation or lugging, and the acceleration only builds as the revs climb. This is not an engine that needs to be kept on the boil; it delivers its best performance exactly where you are most likely to use it in real-world riding.

## Real-World Performance: What the Numbers Mean

Let us put the 2014 Honda Gold Wing Valkyrie horsepower and torque figures into context. A 113 rear-wheel horsepower may not sound overwhelming in an era where 200-horsepower superbikes are commonplace. However, the Valkyrie was never designed to compete with sportbikes. Its purpose

is to deliver effortless, accessible performance in a package that is comfortable, stylish, and genuinely enjoyable to ride at legal speeds.

Consider this: the Valkyrie's power-to-weight ratio is approximately 0.15 horsepower per pound. While that is modest compared to a sportbike, the way the power is delivered makes the bike feel significantly faster than the numbers suggest. The flat torque curve means that acceleration is strong, linear, and always available. There are no flat spots, no waiting for the engine to come on the cam, and no need to constantly shift gears to stay in the powerband.

In quarter-mile testing,

the 2014 Honda Gold Wing Valkyrie consistently runs in the low 12-second range with trap speeds around 110 mph. For a cruiser weighing over 700 pounds, those are genuinely impressive numbers. The Valkyrie can out-accelerate many purpose-built muscle cruisers and even some sport touring machines.

---

### **THE RIDING EXPERIENCE: MORE THAN JUST NUMBERS**

---

Numbers alone cannot convey what it feels like to ride the 2014 Honda Gold Wing Valkyrie. The 2014 Honda Gold Wing Valkyrie horsepower is delivered with a smoothness that is characteristic of the flat-six configuration. There is virtually no

vibration at any rpm, which means you can ride for hours without fatigue. The engine spins up with a turbine-like quality that is both refined and exciting.

The sound is a huge part of the experience. The Valkyrie's exhaust note is deep and throaty at idle, building to a howl as the revs climb. It is not obnoxiously loud, but it is undeniably present. Honda engineers spent considerable time tuning the exhaust to produce a sound that is both pleasing and authoritative without being fatiguing on long rides.

## How the Valkyrie

# Compare s to Competit ors

To fully appreciate the 2014 Honda Gold Wing Valkyrie horsepower, it is helpful to see how it stacks up against its contemporaries:

- **Victory Cross Country 8-Ball:**  
Produces around 85 horsepower from its 1,731cc V-twin. The Valkyrie significantly outpowers this competitor, especially in the mid-range.
- **Harley-Davidson Street Glide:**  
The 103 cubic

inch V-twin produces approximately 70 horsepower. The Valkyrie's 113 horsepower represents a massive advantage.

- **Yamaha Star Stratoliner:** Its 1,854cc V-twin produces about 85 horsepower. Again, the Valkyrie holds a clear edge.
- **Honda Gold Wing F6B:** The same basic engine, tuned slightly differently, produces similar peak numbers but with a different character due to different intake and exhaust tuning.

remains, one of the most powerful production cruisers ever built. Its combination of power, smoothness, and refinement is unmatched in the cruiser segment.

---

### **ENGINEERING EXCELLENCE: WHAT MAKES 113 HORSEPOWER POSSIBLE**

---

The 2014 Honda Gold Wing Valkyrie horsepower figures are a testament to Honda's engineering prowess. The flat-six engine is inherently well-balanced, with primary and secondary forces perfectly canceled out. This allows the engine to rev freely and smoothly, contributing to both performance and rider comfort.

The Valkyrie was, and

# Key Technical Specifications

- **Engine type:**  
1,832cc liquid-cooled horizontally opposed six cylinder
- **Bore and stroke:** 74mm x 71mm
- **Compression ratio:** 9.8:1
- **Fuel system:**  
PGM-FI with six individual 40mm throttle bodies
- **Ignition:**  
Computer-controlled digital with three-dimensional mapping
- **Transmission:**

Five-speed with overdrive

- **Final drive:**  
Shaft drive
- **Peak horsepower:**  
Approximately 113 hp at the rear wheel
- **Peak torque:**  
Approximately 108 lb-ft at 4,000 rpm
- **Redline:** 6,000 rpm (though power is well past its peak by then)

The relatively low compression ratio of 9.8:1 allows the Valkyrie to run on regular unleaded fuel without any issues. This is a practical consideration that makes the bike easy to own and operate, even on long trips where fuel quality may vary.

---

## MODIFICATIONS AND TUNING UNLOCKING MORE

### POTENTIAL

For owners who find the stock 2014 Honda Gold Wing Valkyrie horsepower insufficient, there is a thriving aftermarket industry offering performance upgrades. The most common modifications include:

## Exhaust Systems

Replacing the stock exhaust with a freer-flowing aftermarket system can unlock a modest power gain of 5-8 horsepower, along with a significant reduction in weight and a more aggressive sound. Several manufacturers offer slip-on mufflers or full

systems designed for the Valkyrie.

## Intake Upgrades

Installing a high-flow air filter or a complete intake kit can improve throttle response and add a few horsepower, especially when combined with an aftermarket exhaust and ECU recalibration.

## ECU Tuning

Perhaps the most effective single upgrade is recalibrating the engine control unit. Aftermarket fuel controllers or custom ECU flashes can optimize the air-fuel

ratio and ignition timing for the specific modifications on your bike, unlocking the full potential of the engine. A properly tuned Valkyrie with intake, exhaust, and ECU modifications can produce up to 125-130 horsepower at the rear wheel.

## Final Drive Gearing

Changing the final drive ratio by installing a different gear set can transform the character of the Valkyrie. A lower (numerically higher) final drive ratio improves acceleration at the expense of top speed, making the bike even more responsive

in the mid-range. This is a popular modification for riders who prioritize around-town performance and back-road fun over high-speed cruising.

---

### MAINTAINING THE POWER: KEEPING YOUR VALKYRIE PERFORMING

---

The 2014 Honda Gold Wing Valkyrie horsepower is remarkably durable, but it does require proper maintenance to continue delivering its best. Here are the key maintenance items that directly affect engine performance:

- **Valve adjustments:**  
The Valkyrie requires valve clearance inspection and adjustment every 24,000 miles.

Proper valve adjustment is critical for maintaining maximum power and smooth operation.

- **Spark plug replacement:** Iridium spark plugs should be replaced every 24,000 miles to ensure proper combustion and prevent misfires.
- **Air filter service:** The air filter should be inspected every 8,000 miles and replaced as needed. A dirty air filter can significantly reduce power and fuel economy.
- **Fuel system cleaning:** Using quality fuel and periodically

adding a fuel system cleaner can prevent injector fouling and maintain optimal performance.

- **Cooling system maintenance:** Proper coolant levels and a functioning cooling system are essential for maintaining consistent power output, especially in hot weather or during extended high-speed riding.

---

## CONCLUSION: THE LEGACY OF THE VALKYRIE

---

The 2014 Honda Gold Wing Valkyrie is a motorcycle that defies easy categorization. It is not quite a cruiser, not quite a tourer, and

not quite a muscle bike, yet it incorporates the best elements of all three categories. The 2014 Honda Gold Wing Valkyrie horsepower of 113 horsepower is impressive, but the real story is how that

power is delivered: smoothly, effortlessly, and with a character that is both refined and exciting.

In an era where horsepower figures are often the primary metric
